Greenplum Connection Guide

Available for Enterprise plan

Written by Nick Cox

Updated over a week ago

The Greenplum connector allows data to be cataloged, queried, transformed and to create tables in Greenplum. This can be used to quickly and easily join data between different systems like Greenplum and Hive, or between different Greenplum instances.

The Greenplum connector is available for the Promethium Enterprise plan.

Advanced Parameters >

Greenplum Connection

Greenplum connection details can be case-sensitive. Ensure that data is entered with the correct case for your Greenplum.

Field	Description
Data Source Name	Give the Greenplum connection a unique name for easy identification.
Description	Optional. A meaningful description for this connection.
Host Name	Enter the host name for your Greenplum database. For example: db.company.com
DB Port	Enter the port number for your Greenplum database.
User Name	Enter the username associated with your Greenplum account.
Password	Enter the password associated with your Greenplum account.
Database Name	Enter the database containing the data you want to retrieve.
Data Source Topic	Optional. Categorize the Greenplum connection. For example, Marketing.

What Happens Next - Finish Greenplum Connection

Click the **Connect** button then select schemas. After successful connection and schema selection Promethium will automatically crawl and catalog data in your Greenplum, then make the data easily searchable and usable.

Click **Data Explorer** from the menu and begin exploring the data in your Greenplum database.

FAQs

- **Is my data moved or copied out of Greenplum?**

No. Your data stays in Greenplum and isn't moved to Promethium.

- **What options are available for publishing datasets?**

Datasets can be published as a view, as a table in Greenplum or as a dbt model.

- **Is this a Production-level connector?**

Yes. The Greenplum connector is designed for all-sized Datasets.
